Amblyseius (Neoseiulus) californicus - Application Instructions

Please use immediately upon receipt. For indoor use only

Required conditions:

- Temperature range: 10–35°C
- Humidity: 60% (lower humidity will not kill the *californicus* but will make reproduction difficult)
- Insecticides: Do not apply *californicus* if insecticides were applied in the past 1–2 weeks

Before application:

- If possible, manually remove any webbing on leaves
- Prune any heavily damaged leaves
- Carefully rotate the bottle to evenly distribute predators through carrier material
- Lightly mist plant leaves with water

Application:

- Once opened apply all of the material and do not store
- Sprinkle the material from above plants, focusing on damaged areas, or where webbing has occurred
- Do not use any insecticides once predators have been applied
- Repeat applications may be required

Next Steps:

- Observe Spider Mite levels over the next 7–10 days
- Apply more *californicus* or our *phytoseiulus* predators if levels are not reducing as quickly as desired
- Also consider applying our preventative *californicus* sachets to continue control of Spider Mite
