Drosophila Suzukii Fruit Fly Trap Application Instructions

Required conditions:

- Recommended for outdoor use only due to potency of attractant

Before application:

- Identify a trap placement location that is away from any outdoor seating areas. This ensures that flies will be lured away from your preferred outdoor spots
- Aim to construct traps when sealed indoors, as the attractant may immediately entice flies whilst assembly is configured

Application:

- Fill the trap with some of the included Fruit Fly Liquid Attractant
- Ensure the black hook clip is clicked into the top of the lid
- Hang your trap at a safe height and distance from outdoor eating areas
- The attractant will retain potency for 4-8 weeks

Next Steps:

- Consider activating multiple traps to combat significant Fruit Fly populations
- Once the attractant has lost potency, or the trap is full, pour the liquid and deceased flies into a compost heap
