# Vespa Wasp Trap Application Instructions

## Required conditions:

- For outdoor use only. Deploy as soon as wasp behaviour becomes aggressive

## Before application:

- Identify a trap placement location that is several feet away from any outdoor seating areas. This ensures that wasps will be lured away from your preferred outdoor spots
- Aim to construct traps indoors, as the strong attractant may immediately entice wasps whilst assembly is configured

## Application:

- Pour attractant into the yellow base of the wasp trap (this does not need to be diluted)
- Carefully attach the plastic bucket into the grooves in the yellow base
- Push the plastic strap ends into the holes on the yellow base - make sure they are securely locked in
- Make sure the strap fits securely into the grooves at the top of the plastic bucket
- Tie the string around the holes in the strap
- Hang your trap at a safe height and distance from outdoor eating areas

## Next Steps:

- Traps can be used for several years due to weather-resistant design specifications
- Empty traps as soon as they become saturated with wasps and refill with attractant
- The best way to clean out your trap is to open and submerge it in a large bucket of water. This will drown any wasps that haven't yet died and wash out the remains
