Amblyseius Californicus Predatory Mites Application Instructions

Please use immediately upon receipt for best results

Required conditions:

- Temperature range: **13-32°C**
- Humidity: **60%** (lower humidity will not be fatal but will reduce reproduction)
- Do not apply *Californicus* if insecticides were applied in the past 1-2 weeks

Before application:

- If possible, manually remove any webbing on leaves
- Prune any heavily damaged leaves
- Carefully rotate the bottle to distribute the predators through carrier material
- Lightly mist the leaves of plants you wish to treat with water

Application:

- Sprinkle material from above plants onto damage, or where webbing was present
- Once opened apply all of the material and do not store
- Do not use any insecticides once predators have been applied
- Repeat applications may be required

Next steps:

- Observe pest levels over the next 7-10 days
- Apply more *Californicus* or introduce *Phytoseiulus* predators if infestation levels are not reducing
- Consider also applying preventative sachets of *Californicus* or *Phytoseiulus* predators for continued protection
