Natupol Seeds Hives - Application Instructions

Please use immediately upon receipt

Preparation:

- Natupol Seeds perform best at ambient temperatures between 12-25°C
- Keep hives in a well ventilated environment, out of reach of direct sunlight

Set Up:

- Place the hives on elevated platforms (avoid inclination)
- Natupol Seeds are most effective in greenhouses, polytunnels and allotment areas with plenty of access and proximity to flowering plants
- If placing outside, ensure colonies have some protection from rainfall
- Ensure the hives are visible and place in the shade of plants, or if necessary provide additional shading
- Wait at least 15 minutes after positioning the hive before opening the hive entrance, this will calm the Bumblebees
- Pull the white cap off hives to release the bees. Do not remove the small black hole under the cap

Next Steps:

- Never move an activated hive from one area to another
- Remove hives 6-8 weeks after introduction when all activity has ceased
