

Pantry Moth Pheromone Trap Instructions

The Pantry Moth, often known as the Indian Meal Moth (*Plodia interpunctella*), is a common pest of stored foods. If containers of food, such as flour, cereal, and rice, are left open they can become targets for this moth, which will lay its eggs amongst the stored food. These eggs will hatch into white larvae that will feed on the food material. This quickly makes infested food stuffs inedible.

Required conditions:

- For indoor use only

Before application:

- If you are using our Pantry Moth Egg Killer Sachets, ensure the pheromone trap is set up at a distance from the sachets, so the parasitic wasps do not get stuck in the trap
- Keep any unopened pheromone lures in the fridge or freezer when not required

Application:

- Push the trap together to form a tent-like structure, and peel off the paper inside to reveal a sticky surface
- Open the foil lure sachet, remove the pheromone lure and place it inside the trap
- The male Pantry Moths will then be lured into the trap by the pheromone and caught on the sticky pads inside
- Traps can be placed, or hung, in any food storage areas. The trap is safe, effective and releases no odours

Next Steps:

- To keep the trap active, replace the first pheromone lure after six weeks and use the second lure provided. The trap is supplied with the two lures to provide you with a 12 week catching period.

We recommend combined use of Pantry Moth Traps and our Pantry Moth Egg Killer Sachets to ensure the pest is controlled at both its adult and larval life cycle stages. Visit our website for more information and submit an order today.
