Wasp & Fly Trap Application Instructions

Required conditions:

- For outdoor use only. Deploy as soon as wasp behaviour becomes aggressive

Before application:

- Identify a trap placement location that is several feet away from outdoor seating areas. This ensures that wasps are lured away from your preferred spots
- Aim to construct traps sealed indoors as the strong attractant may immediately entice wasps whilst assembly is configured

Application:

- Pour attractant into yellow base of trap (this does not need to be diluted)
- Carefully slide the transparent plastic bucket into the grooves of the filled yellow base
- Make sure the bucket is securely locked in on top of the yellow base
- Attach the green string to the raised pieces of plastic on top of the plastic bucket and secure tightly
- Hang your trap at a safe height and distance from outdoor eating areas

Next Steps:

- Traps can be used for several years due to weather-resistant design specifications
- Empty traps as soon as they become saturated with wasps and flies, then refill with more attractant
- The best way to clean out your trap is to open and submerge it in a large bucket of water. This will drown any live wasps and wash out all catches
